23. Future V2 / V3 Backlog

1. Executive Vision & Product Positioning

1. Build a premium, fast, trustworthy and medically responsible website for Dr. Noopur Patel. The website must function as a digital professional identity, patient education hub, local discovery asset, referral/networking profile and appointment-routing layer.
2. North-star: understand identity within 5 seconds; specialty within 10 seconds; official appointment route within 15 seconds; educational content remains readable and clinically credible.

2. Verified Doctor Facts & Content Governance

1. Name: Dr. Noopur Patel
2. Current listed role: Associate Consultant – Surgical Breast Oncology
3. Current listed designation: Breast Cancer Surgeon
4. Current listed hospital: Marengo CIMS Hospital, Ahmedabad, Gujarat
5. Qualifications listed by the hospital: MBBS, MS (General Surgery), Fellowship in Breast Surgery
6. Hospital-listed training: Max Healthcare Fellow (Breast Oncology), November 2023–December 2024
7. Hospital-listed education: MS (General Surgery), SMIMER, June 2017–September 2020

8. Hospital-listed education: MBBS, AMC MET Medical College, August 2009–March 2015
9. Hospital-listed professional areas: benign breast diseases, malignant breast diseases, breast surgery including mastectomy and breast-conservative surgery, oncoplastic breast surgery, breast oncology clinical research
10. Hospital address listed in public material: Off. Science City Road, Sola, Ahmedabad – 380060
11. Verified against the Marengo CIMS Hospital public doctor profile and related hospital publications. Exact current employment dates, consultation schedule, personal contact details, registration numbers, fees, and any additional credentials must be confirmed by the doctor/hospital before publication.

3. Business Goals & Success Metrics

1. Professional credibility; local discovery; appointment intent; education; referrals; performance. Baseline KPIs for 30 days after launch and iterate using measured evidence.

4. Target Audiences & User Journeys

1. Patient/family → understand specialty → appointment.
2. Referred patient → verify expertise/location → official booking.
3. Doctor/healthcare professional → credentials/experience → professional contact.
4. Search visitor → answer identity/specialty quickly → appointment or education.

6. Page-by-Page PRD

- Home: hero, identity, specialty, CTAs, trust strip, expertise, introduction, hospital route, articles, FAQ.
- About/Doctor: portrait, credentials, professional story, training and experience timeline.
- Expertise: overview plus individual educational pages for approved specialties/procedures.
- Education/Blog: searchable educational library with author, review date and medical reviewer.
- FAQ: patient questions with concise clinically reviewed answers.
- Appointment: official hospital/clinic booking route; minimize collected patient data.
- Contact: verified location and official contact channels.

7. UX / UI Design System

- Premium editorial healthcare aesthetic; calm, expert, compassionate, modern and precise.
- Deep navy + clinical teal + warm white; restrained accent; high contrast.
- Mobile-first navigation with reachable primary CTA.
- Use real doctor photography; no graphic surgical imagery.
- Motion is subtle, 150–500ms, transform/opacity based, and respects reduced-motion.

8. Functional Requirements

- Responsive 360px to large desktop; clear navigation; official appointment CTA; blog/CMS; FAQ; location; authentic social proof only; analytics; custom 404 and robust error states.

9. Medical Content & Compliance Requirements

- Informational/educational only; no diagnosis or individualized treatment.
- No cure/survival/result guarantees; no fake testimonials or fabricated patient stories.
- No identifiable patient information without appropriate consent and lawful basis.
- Medical articles require author, review date and clinical reviewer metadata.
- Appointment routing should prefer the official hospital system.

10. Technical Architecture

- Recommended: Next.js App Router + TypeScript + Tailwind CSS; lightweight motion; headless/custom CMS; PostgreSQL/Supabase where structured data is needed; optimized image CDN; Vercel or equivalent; transactional email; analytics; Sentry/equivalent monitoring.
- Principles: server-render by default, typed models, schema validation, secure environment variables, static/ISR public content, optimized images, complete handover docs.

11. Data Model & CMS

- DoctorProfile, Experience, Education, Expertise, Article, FAQ, Location, MediaAsset, SiteSettings.
- Editorial status: draft → clinical_review → approved → scheduled → published → archived.

12. SEO & Local Search Strategy

- Canonical intent-based pages; clean metadata; internal linking; valid structured data; no fake reviews/rating schema; verified NAP; Search Console; topic clusters.
- Initial themes: Dr Noopur Patel Ahmedabad, Breast cancer surgeon Ahmedabad, Surgical breast oncology Ahmedabad, Breast surgery Ahmedabad, Oncoplastic breast surgery Ahmedabad.

13. Performance, Accessibility & Reliability

- Optimize LCP/CLS/INP; AVIF/WebP; responsive images; limited fonts; semantic HTML; keyboard navigation; visible focus; contrast; graceful failures; tested backups.

14. Security & Privacy

- HTTPS/HSTS, security headers, CSP, rate limits, spam protection, validation/sanitization, minimum data collection, no sensitive medical data in basic forms/analytics, RBAC/MFA, audit logs, tested backups.

15. Analytics & Conversion Tracking

- Track appointment_cta_click, hospital_booking_click, phone_click, article_view, 50% scroll, form start/submit, external profile click.
- Never place diagnosis, symptoms or health details in analytics parameters.

16. Admin / Content Management

- Dashboard, Doctor Profile, Experience, Education, Expertise, Blog, FAQ, Media, SEO Center, Site Settings, Audit Log.
- Unreviewed medical claims must not be publishable when clinical review is enabled.

17. AI Coding Agent Operating Rules

- Read the entire repository and existing architecture before changing code.
- Do not rewrite working systems without evidence that the rewrite is necessary.
- Create a short implementation plan before each major step.
- Keep TypeScript strict; avoid any unless justified and documented.
- Use reusable components and typed domain models.
- Do not hard-code credentials, tokens, phone numbers or unverified medical facts.
- Treat medical content as controlled content; never invent credentials, procedures, statistics or patient outcomes.
- Preserve SEO semantics: one H1 per page, meaningful headings, metadata and canonical URLs.
- Build mobile-first and test at 360px, 390px, 768px, 1024px and desktop widths.
- Prefer server components and static/ISR rendering where possible.
- Keep client-side JavaScript minimal.
- Every new dependency must have a reason and be evaluated for bundle/performance impact.
- Add loading, empty, error and not-found states.
- Add automated validation for critical routes and content schemas.
- Do not mark a phase complete without evidence: build, typecheck, lint, tests and browser QA.
- After implementation, produce a concise change log, test evidence and remaining risks.

18. 5-Phase / 15-Step Development Roadmap

- Phase 1 — Foundation: repo audit; design system; Home/About/Doctor.
- Phase 2 — Expertise + Content: expertise taxonomy; CMS/editorial workflow; FAQ/related content.
- Phase 3 — Conversion: appointment routing; location/contact; analytics/consent.
- Phase 4 — Hardening: SEO; performance/accessibility; security/privacy/monitoring.

- Phase 5 — Certification: full QA; doctor/hospital content verification; launch/monitoring.

19. SRS Acceptance Criteria

- All production routes return correct HTTP status codes.
- Home page communicates doctor identity and specialty immediately.
- All credentials and employment claims match approved source material.
- Appointment CTA points to an approved official destination.
- No placeholder text, lorem ipsum or fake testimonials remain.
- All images have appropriate alt text; decorative images are marked decorative.
- Keyboard navigation works across interactive components.
- Mobile navigation is functional without horizontal scrolling.
- 404 page provides a useful recovery path.
- Blog articles expose author/reviewer/date metadata where required.
- Medical disclaimer is accessible from relevant patient-education content.
- Sitemap and robots are valid and production-aware.
- Canonical URLs are correct.
- Structured data validates without fabricated fields.
- Analytics events do not contain sensitive medical data.
- Production build passes typecheck/lint/tests.
- Monitoring is active and a test error can be observed safely.
- Backup/restore procedure is documented if custom CMS data is used.

20. QA / Testing / Production Certification

- Unit, integration, E2E, visual, accessibility, SEO, performance, security and content testing are all required.
- Certification requires both technical QA and doctor/hospital content approval.

21. Launch Checklist

- Domain/DNS/HTTPS; env validation; profile and credential approval; hospital booking verification; legal pages; OG/favicons; Search Console; analytics; monitoring; forms; error states; mobile/desktop QA; backup/rollback.

22. Post-Launch Growth Roadmap

- Days 1–7: monitoring and indexing verification. Days 8–30: Search Console and conversion baseline. Month 2: high-quality educational content. Month 3: professional ecosystem and referral resources. Quarterly: content, credentials, security and performance audits.

23. Future V2 / V3 Backlog

- English + Gujarati/Hindi with human clinical review; publications library; conference/speaking profile; professional referral resources; newsletter; advanced search; official appointment API integration if available; structured clinical FAQ knowledge base; content performance dashboard.
- Do not add patient accounts, medical document uploads, diagnosis tools, symptom checkers or telemedicine in V1 without separate compliance, security and clinical governance approval.

FINAL BUILD DIRECTIVE

Treat this document as the master source of truth. If repository realities conflict with this document, identify the conflict and propose the smallest safe change rather than silently overriding architecture.

- Premium visual identity
- Accurate doctor profile
- Fast mobile experience
- Strong technical SEO
- Accessible UI
- Secure and privacy-conscious architecture
- Controlled medical content workflow
- Clear appointment routing
- Production monitoring
- Complete QA evidence
- Doctor/hospital content approval
- Deployment + handover documentation
